Forty-four patients with relapsed or refractory acute lymphoblastic leukemia and six with relapsed or refractory non-Hodgkin's lymphoma underwent therapy with total body irradiation (TBI) (12.5-15 Gy) followed by bone marrow transplantation (BMT). Conditioning regimens included cyclophosphamide (CY), total body irradiation (TBI) and etoposide (CY/TBI/VP-16). Cyclosporine A was used for graft-versus-host disease (GVHD) prophylaxis and, at the time of relapse, various intensive regimens including high-dose cytosine arabinoside (HD-Ara-C) and thioguanine (HD-Thio) were used to induce a graft-versus-leukemia (GVL) effect. The median time from relapse to TBI was 2.9 months. The median number of TBI doses was 7 and the median total radiation dose received by the central nervous system was 8.5 Gy. The actuarial overall survival was 39.6% at 1 year and 20.8% at 3 years. The actuarial disease-free survival (DFS) was 33.3% at 1 year and 14.8% at 3 years. The probability of 3-year DFS was 50% in patients with relapsed and refractory ALL. The survival of patients transplanted for non-Hodgkin's lymphoma was better than that of ALL
